

COMP1022Q
Introduction to Computing with Excel VBA

Introduction to Looping

David Rossiter, Gibson Lam, Eddie Chan

What is Looping?

- A loop is a set of code which repeats many times
- Looping is a very useful feature in programming languages such as VBA because it makes repetitive work easier
- For example, you can use a nested loop to generate a chess board
- In this presentation we will look at two types of loops:
 - While Loops
 - Do Loops

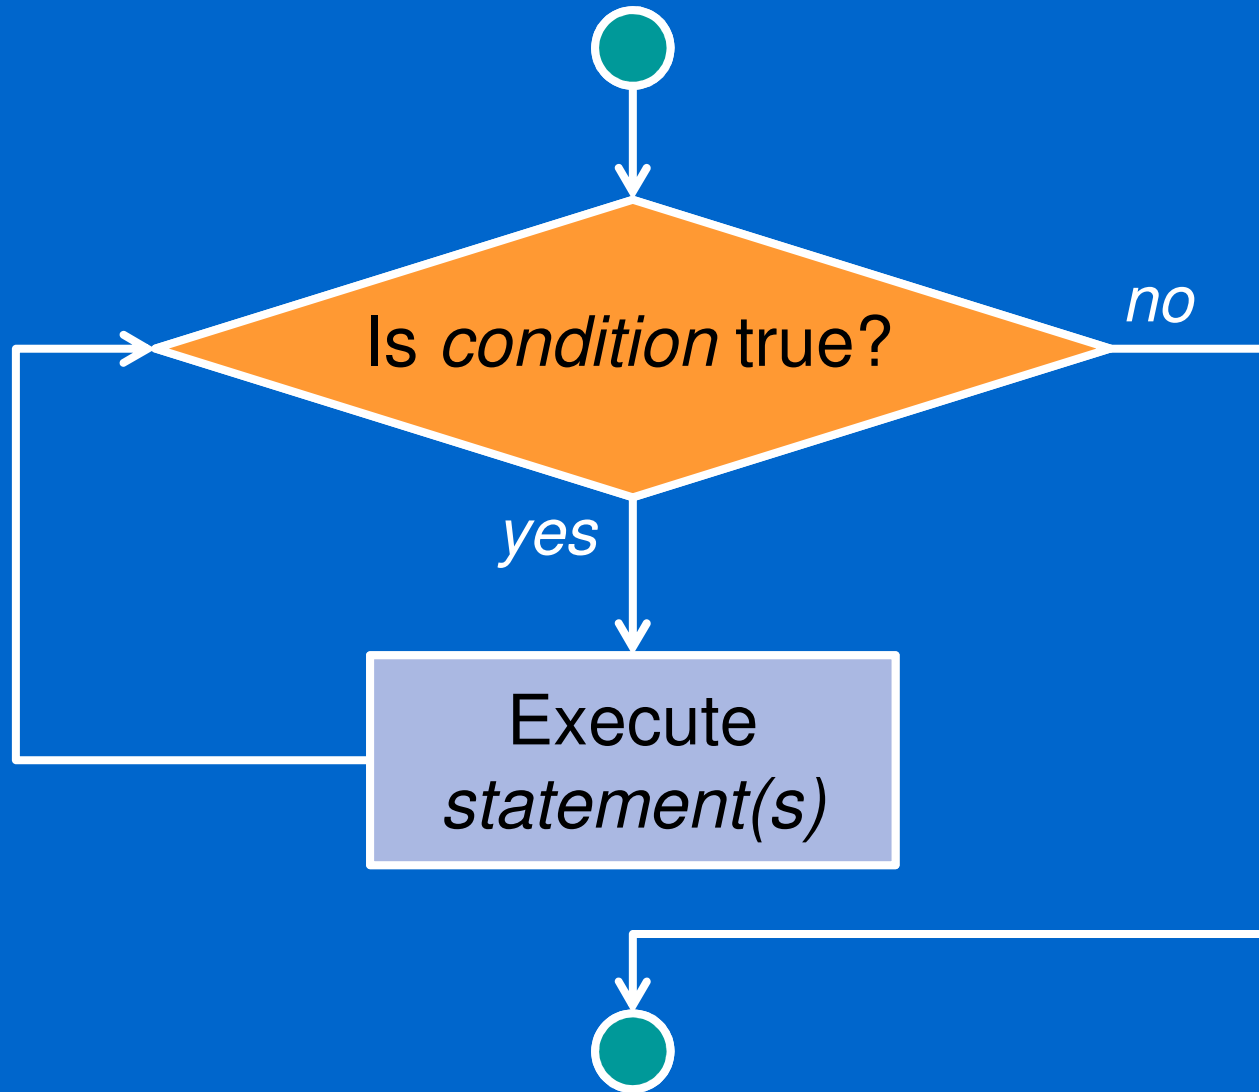

While...Wend

```
While ...condition...  
    ...statement(s)...  
Wend
```

- While *condition* is true, repeatedly execute *statement(s)*
- When *condition* is false, *While...Wend* finishes

The Flow of While...Wend

Reading/Writing Worksheet Cells Using Range()

- You have seen the use of Range () to read and write a cell value, for example:

```
' Put the value of cell B4 into MyVar
```

```
MyVar = Range("B4").Value
```

```
' Put the text "Hello" into cell C4
```

```
Range("C4").Value = "Hello"
```

- Range () uses a cell reference, e.g. A4
- It can also refer to multiple cells like this:

```
' Copy the content of five cells in column A
```

```
Range("A6:A10").Copy
```

Alternative Way to Read/Write Worksheet Cells

- Another way to read/write a cell is to use `Cells()`
- For example, to read cell B1 with `Cells()`, you need to do this:

```
MyVar = Cells(1, 2).Value
```

*The row and
column number
of the cell*

- The good thing about `Cells()` is that you only need to give the row and column number of the cell you want
- However, that means you can only refer to one single cell using `Cells()`

Working with the Currently Selected Cell

- Sometimes you want to do something with the currently selected cell but you don't know which cell is currently selected
- In VBA, `ActiveCell` is the currently selected cell
- For example, the following line of code changes the font of the currently selected cell to bold:

```
ActiveCell.Font.Bold = True
```

Useful Things You Can Do With a Cell

- Find out the row number or column number of the cell

```
Range("B4").Row      ' Return 4
```

```
Range("E8").Column   ' Return 5
```

- Change the currently selected cell

```
Cells(5, 4).Select   ' Select cell D5
```

- Refer to a cell relative to another cell

```
Range("D7").Offset(1, 0) ' Return cell D8  
                        ' (move down one row)
```

```
Range("B1").Offset(2, 0) ' Return cell B3  
                        ' (move down two rows)
```

```
Range("A5").Offset(0, 2) ' Return cell C5  
                        ' (move right two columns)
```

```
Range("E6").Offset(0, -2) ' Return cell C6  
                        ' (move left two columns)
```

An Example of While...Wend (1/2)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While ActiveCell.Row <= 10
```

Loop condition

```
' Put the row number into the first cell  
ActiveCell.Value = "I am row " & _  
ActiveCell.Row
```

*Loop
body*

```
' Move the selection down one cell  
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

*This line of code selects the
cell on the row following the
currently selected cell*

An Example of While...Wend (2/2)

	A	B	C	D	E
1	Showing Row Numbers from Row 4 to Row 10				
2	<i>This example puts the row number in the first cell of each row from row 4 to row 10. The VBA code is run when you open the worksheet.</i>				
3					
4	I am row 4				
5	I am row 5				
6	I am row 6				
7	I am row 7				
8	I am row 8				
9	I am row 9				
10	I am row 10				
11					
12					

Running the While...Wend Example (1/10)

```
' Select the first cell in the 4th row
```

```
 Cells(4, 1).Select
```

*The first cell
in row 4 is
selected*

```
While ActiveCell.Row <= 10
```

```
    ' Put the row number into the first cell
```

```
    ActiveCell.Value = "I am row " & _  
                        ActiveCell.Row
```

```
    ' Move the selection down one cell
```

```
    ActiveCell.Offset(1, 0).Select
```

```
Wend
```

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4		
5		
6		
7		
8		
9		
10		
11		

Running the While...Wend Example (2/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

→ While ActiveCell.Row <= 10 →

```
' Put the row number into the first cell  
ActiveCell.Value = "I am row " & _  
    ActiveCell.Row
```

```
' Move the selection down one cell  
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

The condition is true because the active cell is in row 4 (<=10)

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4		
5		
6		
7		
8		
9		
10		
11		

Running the While...Wend Example (3/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While ActiveCell.Row <= 10
```

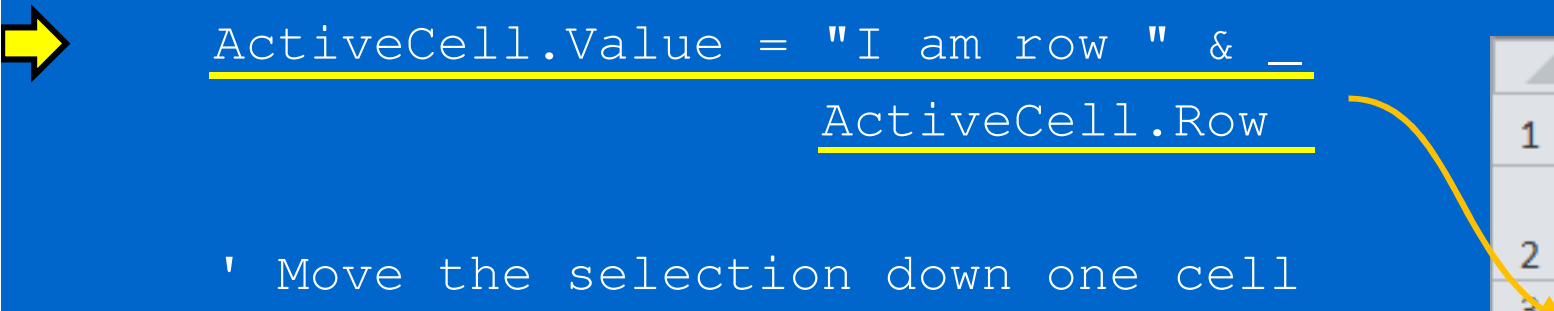

```
' Put the row number into the first cell
```

```
ActiveCell.Value = "I am row " & _  
ActiveCell.Row
```

```
' Move the selection down one cell
```

```
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

	A	E
1	Showing Row N	
	<i>This example puts the</i>	
2	<i>10. The VBA code is</i>	
3		
4	I am row 4	
5		
6		
7		
8		
9		
10		
11		

Running the While...Wend Example (4/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While  ActiveCell.Row <= 10  
    ' Put the row number into the first cell  
    ActiveCell.Value = "I am row " & _  
        ActiveCell.Row
```

```
    ' Move the selection down one cell  
    ActiveCell.Offset(1, 0).Select
```

Wend

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5		
6		
7		
8		
9		
10		
11		

*The cell on
the next row
is selected*

Running the While...Wend Example (5/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

→ While ActiveCell.Row <= 10 →

```
' Put the row number into the first cell  
ActiveCell.Value = "I am row " & _  
    ActiveCell.Row
```

```
' Move the selection down one cell  
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

*The condition
is true because
the active cell
is now in row 5*

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5		
6		
7		
8		
9		
10		
11		

Running the While...Wend Example (6/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While ActiveCell.Row <= 10
```

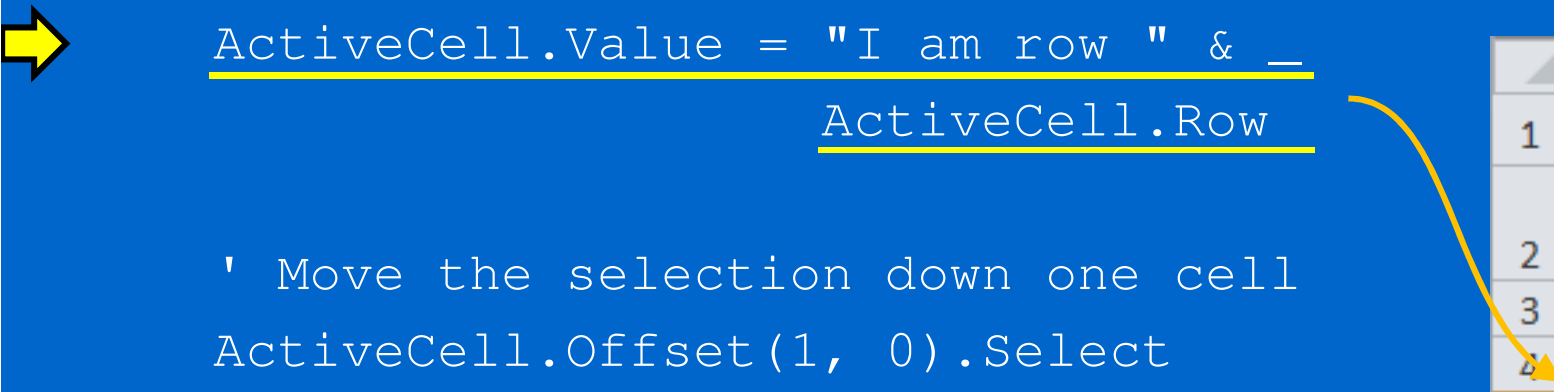

```
' Put the row number into the first cell
```

```
ActiveCell.Value = "I am row " & _  
ActiveCell.Row
```

```
' Move the selection down one cell
```

```
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

	A	E
1	Showing Row N	
2	<i>This example puts the</i>	
3	<i>10. The VBA code is</i>	
4	I am row 4	
5	I am row 5	
6		
7		
8		
9		
10		
11		

Running the While...Wend Example (7/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While ActiveCell.Row <= 10  
    ' Put the row number into the first cell  
    ActiveCell.Value = "I am row " & _  
        ActiveCell.Row
```

```
    ' Move the selection down one cell  
    ActiveCell.Offset(1, 0).Select
```

Wend

	A	E
1	Showing Row N	
2	<i>This example puts the</i>	
3	<i>10. The VBA code is</i>	
4	I am row 4	
5	I am row 5	
6		
7		
8		
9		
10		
11		

*The cell on
the next row
is selected*

Running the While...Wend Example (8/10)

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6		
7		
8		
9		
10		
11		

Next
iteration

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7		
8		
9		
10		
11		

Next
iteration

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8		
9		
10		
11		

Next
iteration

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9		
10		
11		

Next
iteration

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9	I am row 9	
10		
11		

Next
iteration

	A	B
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9	I am row 9	
10	I am row 10	
11		

Running the While...Wend Example (9/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

→ While ActiveCell.Row <= 10 →

```
' Put the row number into the first cell  
ActiveCell.Value = "I am row " & _  
ActiveCell.Row
```

```
' Move the selection down one cell  
ActiveCell.Offset(1, 0).Select
```

```
Wend
```

*The condition
is false when
the active cell
is in row 11*

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9	I am row 9	
10	I am row 10	
11		

Running the While...Wend Example (10/10)

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
While ActiveCell.Row <= 10  
    ' Put the row number into the first cell  
    ActiveCell.Value = "I am row " & _  
        ActiveCell.Row
```

```
    ' Move the selection down one cell  
    ActiveCell.Offset(1, 0).Select
```

 Wend

Since the condition is false the contents of the loop do not get executed, and the loop finishes

	A	E
1	Showing Row N	
2	<i>This example puts the</i>	
3	<i>10. The VBA code is</i>	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9	I am row 9	
10	I am row 10	
11		

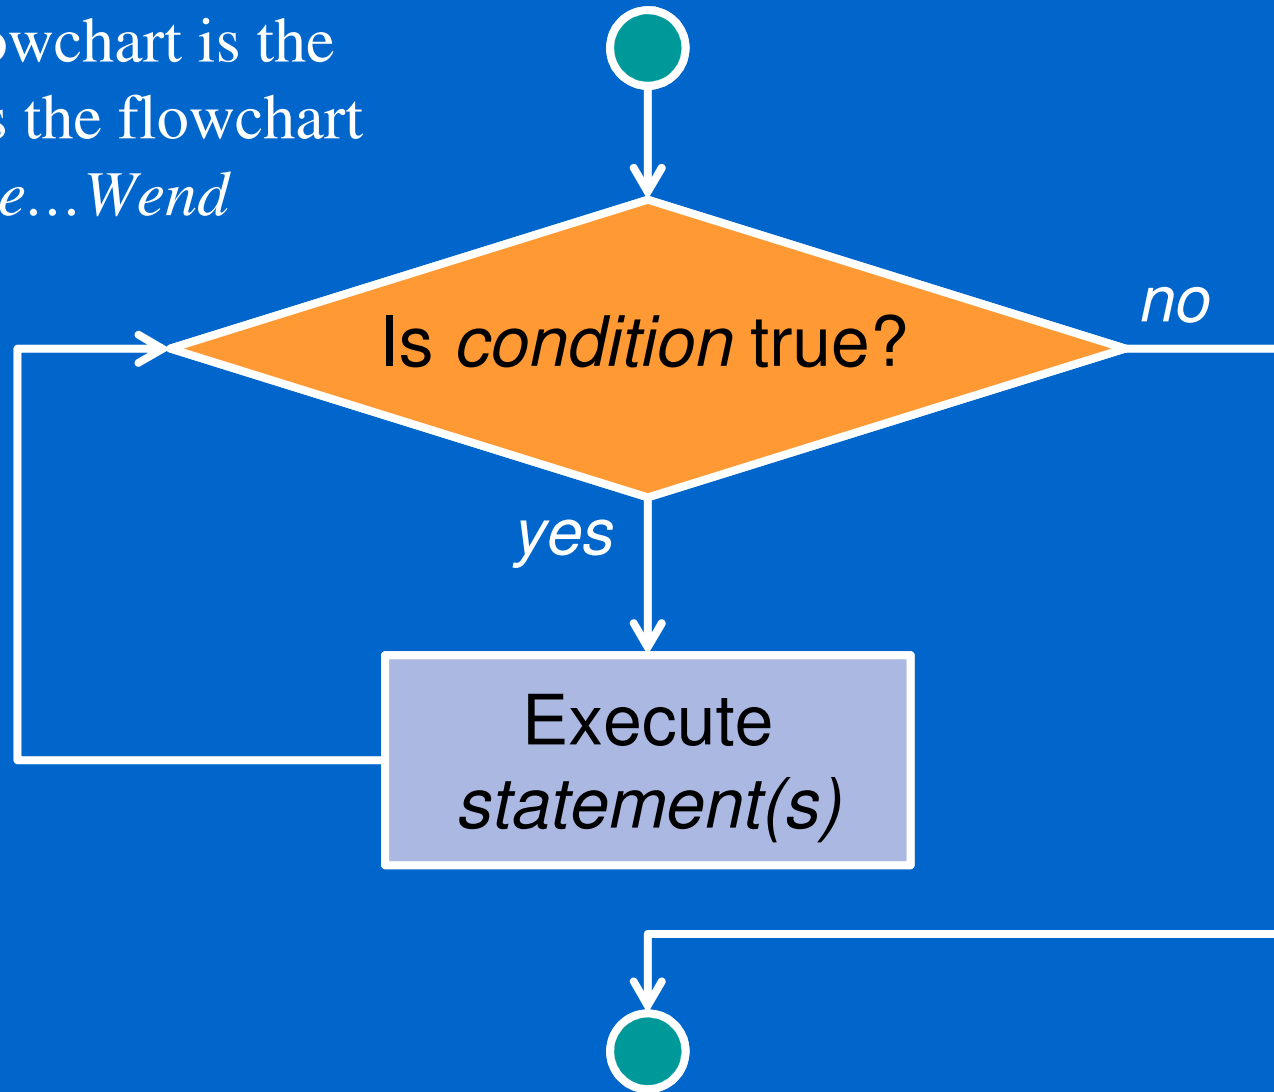

Do While...Loop

```
Do While ...condition...  
    ...statement(s)...  
Loop
```

- The usage of *Do While...Loop* is exactly the same as *While...Wend*
- The difference is that the keywords of *Do While...Loop* are more ‘English’ than *While...Wend*

The Flow of Do While...Loop

- This flowchart is the same as the flowchart of *While...Wend*

Example of Do While...Loop

- For example, we can create a program which does the same thing as the *While...Wend* example using *Do While...Loop*:

```
' Select the first cell in the 4th row  
Cells(4, 1).Select
```

```
Do While ActiveCell.Row <= 10
```

Loop condition

*Loop
body*

```
' Put the row number into the first cell  
ActiveCell.Value = "I am row " & _  
ActiveCell.Row
```

```
' Move the selection down one cell  
ActiveCell.Offset(1, 0).Select
```

Loop

	A	E
1	Showing Row N	
2	This example puts the	
3	10. The VBA code is	
4	I am row 4	
5	I am row 5	
6	I am row 6	
7	I am row 7	
8	I am row 8	
9	I am row 9	
10	I am row 10	
11		

Do...Loop While

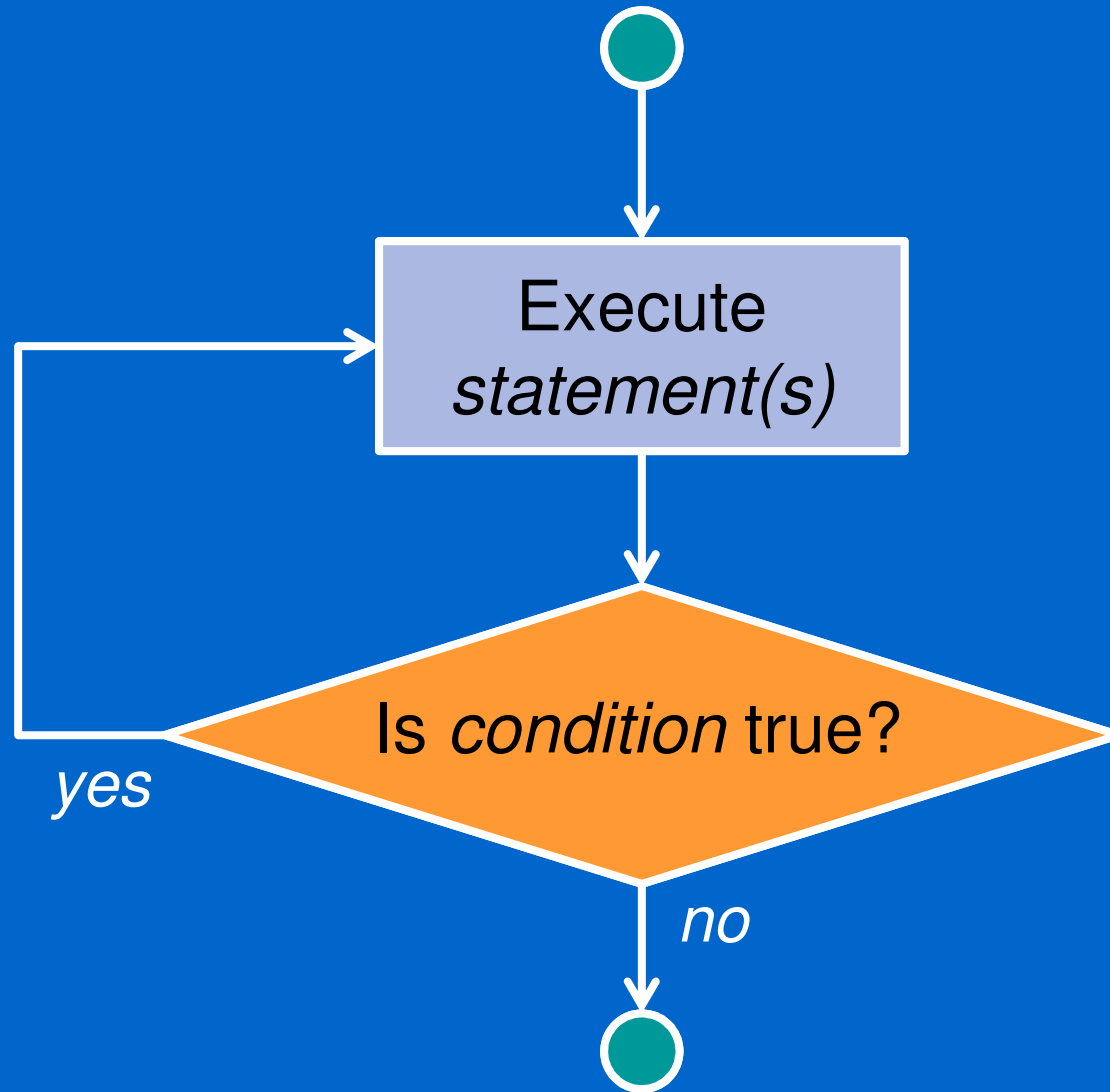

Do

...*statement(s)*...

Loop While ...*condition*...

- This is similar to the previous two loops we looked at but *condition* is evaluated **after** *statement(s)* is executed
- This means that *statement(s)* will be executed at least once before *condition* is evaluated

The Flow of Do...Loop While

An Example of Do...Loop While (1/3)

' Execute the loop at least once

Do

Loop body { ' Ask a question
Answer = InputBox("Do you think
comp1022q is a great course?")

' Check the answer at the end of the loop

Loop While LCase(Answer) <> "yes"

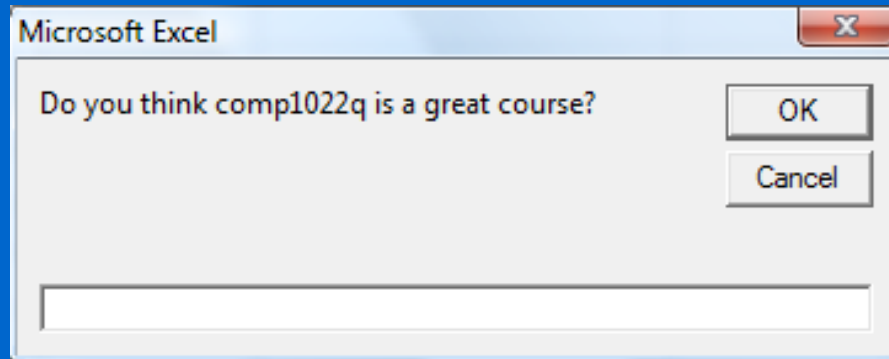

Loop condition

The LCase() method changes all letters in some text into lower case letters, e.g.:

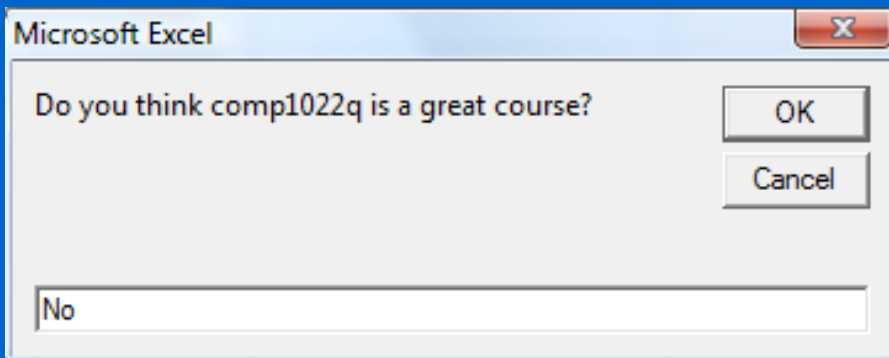

LCase("BIG") → "big"

LCase("How Are You") → "how are you"

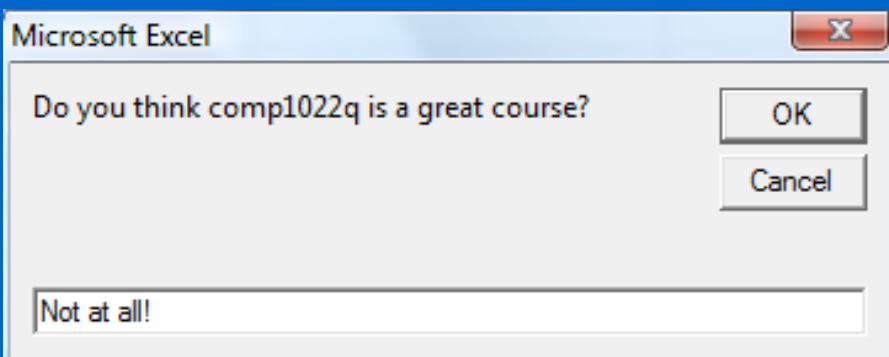

An Example of Do...Loop While (2/3)

You need to answer a question in an InputBox

If you answer 'No' you will be asked again

If you answer 'Not at all!' you will be asked again

An Example of Do...Loop While (3/3)

If you answer 'I don't think so' you will be asked again

You will not be asked the question again if you answer 'Yes'

- In this example, if you answer 'Yes', 'yes', 'YES' they will all stop the InputBox from showing up again
